

Solution Architecture & Tech Stack

The scrim network for Philippine collegiate esports — a Next.js PWA on Vercel, backed end-to-end by Supabase.

Everything competitive is scoped to a `game_id`, and each game is a config row (rank tiers + form fields), so a fifth title is a data insert, not a code change. Accounts are one row carrying a `roles[]` array (player / handler / both); nav gates handler tools on the role rather than forking the app. **Rank verification is human-reviewed and identical across every game** — including the three with no developer API. A player submits a per-game form plus a screenshot, which lands in Supabase Storage; an admin approves or rejects it in a moderation queue. Approval flips the badge to **Verified** and seeds the team's starting rating — from there, dual-confirmed match results move it via an in-DB Elo trigger. A trusted-submitter fast-track auto-approves clean histories, keeping the queue small as the platform grows. The architecture is deliberately modular — feature folders, a schema that tolerates new entity types — so the Stage-2 surprise requirement can be absorbed without a rewrite.

LAYER	CHOICE	WHY
Frontend	Next.js 16 · React 19 · TS · Tailwind v4	One codebase; PWA now, native later.
Data & Realtime	Supabase Postgres + RLS + Realtime	Auth, storage, live updates — one managed service.
Auth	Supabase Auth + roles[], @*.edu.ph	Establishes the collegiate tie; COR review as fallback.
Storage	Supabase Storage (RLS)	Rank-proof screenshots, owner + approved reads only.
Rating engine	In-DB Elo trigger	No external API; identical logic across all 4 games.
Hosting	Vercel	Preview deploys wired to the repo from hour one.

Account roles — one `User` row with a switchable `roles` array: **Player** (profiles, teams, leaderboards, free agent board), **Team Handler** (creates/manages a team, listings, results), or **Both** — the common player-captain case.

UI Wireframe

Mobile-first — the product ships as an installable PWA. Dark, dense, high-contrast: the visual language competitive players already expect, not a generic social-app look.

● MLBB ● Valorant ● Dota 2 ● CoDM

Screen notes

- **1 · Scrim Finder (hero)** — filterable feed of available teams in the selected game: rank band, time window, format. Each card shows team name, school, rating, reliability score, verified badge, and a one-tap Request Scrim.
- **2 · Rank Submission** — per-game form plus screenshot upload, with pending / verified / rejected status states. The trust mechanism the whole rating system rests on.
- **3 · Leaderboards** — team ⇌ player toggle within the game, filterable by region and school, sortable by competitive rating or community standing.
- **4 · Match Room** — the booked scrim: agreed ruleset locked, opponent contact, live countdown, and the dual-confirmation result flow.
- **5 · Meetups & Events** — campus LANs, watch parties, and onsite finals with RSVP and QR check-in state, plus the game's announcement board — the same visual weight as the Scrim Finder, so the balance pillar is visible, not just claimed.
